TECHFEST 2025-26
AI Eduthon

Aim: **Medha AI**, Cograd's flagship educational technology platform, is designed to revolutionize rural education in India by addressing multilingual learning, resource constraints, and accessibility challenges. This competition acts as an innovation incubator for Medha AI's ecosystem, inviting talented teams to develop breakthrough features and sub-products that will directly integrate into the platform.

Competition Overview: Transform education in rural India through innovative AI solutions that address real-world challenges in multilingual learning, resource constraints, and accessibility. This 8-week intensive competition targets the development of production-ready, scalable educational technologies that can operate effectively in low-resource environments while maintaining high educational standards.

NOTE: Participants must now choose one problem statement from the options provided and register their selection on the Techfest website:

For complete details of every Problem Statement, Phase and Round, visit:
https://techfest.cograd.in/

Problem Statement 1 : Multilingual Content Generation Crisis

Challenge Overview:

Design a lightweight, multilingual AI system to generate educational content across all 25 scheduled Indian languages, including key regional dialects like Bhojpuri and Santali.

The Problem:

Rural Indian students face significant barriers in accessing quality educational content in their native languages. Current educational AI systems are predominantly English-focused and fail to serve the linguistic diversity of India's student population. There's an urgent need for a system that can generate culturally relevant, curriculum-aligned educational content across multiple languages while operating on resource-constrained devices.

Core Requirements:

1.Script Accuracy Assurance

- Guarantee correct usage of characters, numbers, and symbols for complex subjects such as mathematics and science across all supported scripts

2. Age-Appropriate Scaling

- Adapt curriculum topics (e.g., Photosynthesis) to different grade levels (Class 3, 8, 12) with appropriate depth, vocabulary, and examples

3.Cultural Relevance Embedding

- Integrate region-specific festivals, stories, and local references while maintaining a pan-Indian educational perspective

4.Code-Mixing Fluency

- Seamlessly handle mixed-language content (e.g., Hindi-English, Punjabi-English) without losing readability or comprehension

5.Curriculum Alignment

- Strictly adhere to NCERT, CBSE, and state board standards with factual accuracy above 95%.

6.Accessibility Support

- Provide learning-friendly outputs for students with dyslexia, visual impairments, or other learning challenges

7.Offline Optimization

- Run efficiently on low-resource devices (4–8 GB RAM), ensuring smooth operation in low-connectivity or offline rural settings

Technical Challenge:

Develop a compact multilingual Large Language Model (1–2 billion parameters) that solves the fundamental trade-off between model capability and resource constraints. Your solution must employ advanced techniques such as:

1.Model Architecture Innovation:

- Knowledge distillation from larger multilingual models while preserving cultural nuances
- Novel quantization strategies that maintain script accuracy for complex mathematical notation
- Efficient attention mechanisms optimized for code-switching scenarios

2.Training and Data Engineering:

- Curriculum-aligned training data synthesis across 25 Indian languages
- Balanced representation learning that prevents dominant language bias
- Few-shot learning capabilities for regional dialects with limited training data
- **Fine-tuning on Educational Corpora**: Mandatory fine-tuning on NCERT curriculum data, regional textbooks, and culturally-relevant educational content to ensure domain expertise and pedagogical accuracy

3.Deployment Optimization:

- Model compression techniques that preserve educational content quality
- Memory-efficient inference strategies for 4-8 GB RAM constraints
- Latency optimization for real-time content generation in offline environments
- **Post-Training Optimization**: Fine-tuning optimization techniques including LoRA, QLoRA, and parameter-efficient methods to maintain quality while reducing computational requirements

4.Cultural and Linguistic Intelligence:

- Context-aware cultural adaptation without stereotyping
- Accurate handling of linguistic variations within the same script family
- Preservation of educational intent across language translations

Expected Solution Quality:

Your solution must demonstrate a **production-ready prototype** that includes working implementations of core components, comprehensive evaluation metrics, and a clear deployment strategy for rural environments.

Solution Architecture Requirements:

Mandatory Components:

- Multilingual transformer architecture with demonstrated compression techniques
- Cultural context embedding system with regional adaptation capabilities
- Script processing pipeline supporting complex mathematical and scientific notation
- Curriculum alignment engine with automated content validation
- Accessibility framework with multiple accommodation strategies

Domain-Specific Fine-Tuning Pipeline: Comprehensive fine-tuning system using educational datasets, curriculum-specific corpora, and cultural adaptation data with measurable quality improvements over base models

Bonus Features: Advanced Voice Assistant Integration

Next-Generation Voice-Enabled Teaching:

- **Natural Conversational Teaching**: teachers engage in free-flowing educational conversations with students using advanced dialogue systems
- **Voice-Controlled Bot Customization**: Teachers and students can verbally customize Bot appearance, teaching style, and personality traits
- **Multi-Speaker Classroom Management**: Handle multiple student voices simultaneously in group learning scenarios
- **Emotional Voice Response**: bot responds to student emotional cues detected through voice tone and adjusts teaching approach accordingly
- **Voice-Based Content Creation**: Teachers can create new lessons by speaking to the bot, which then generates appropriate visual and interactive content

Implementation Note: Voice integration should leverage the same real-time translation capabilities as the core and maintain cultural and linguistic authenticity, you will benefit from this feature.

Problem Statement 2: Personalized Presentation Generation for Education

Challenge Overview:

Design an intelligent, adaptive, and teacher-friendly presentation generation platform that creates **personalized, content-aware, and multimodal slides** from natural language prompts. The system must support **automatic content structuring, relevant image retrieval, and optional 3D rendering**, enabling educators to rapidly generate engaging, visually rich, and pedagogically aligned presentations tailored to their teaching goals.

The Problem:

Teachers and educators often spend a significant amount of time preparing slides for lessons, workshops, or academic lectures. Existing tools are **manual, time-consuming, and lack personalization**, making it difficult to adapt presentations to different teaching styles, student levels, or classroom environments. Finding **relevant images, charts, and 3D visualizations** requires additional effort, often leading to generic or low-engagement content. There is an urgent need for a **personalized presentation generation system** that leverages AI to reduce preparation time while maximizing instructional impact.

Core Requirements:

1.Personalized Content Generation

- Generate complete slide decks from teacher prompts or lesson outlines.
- Tailor content depth and style for audience type (school, college, training, professional).
- Adjust language complexity, tone, and examples to match student proficiency levels.

2.Intelligent Media Integration

- Automatically fetch **contextually relevant images, diagrams, and infographics**.
- Support **3D rendering and animations** for complex concepts (e.g., molecules, mechanical parts, anatomy).
- Enable multimodal input (voice prompt → slide generation).

3.Adaptive Presentation Structuring

- Organize slides into logical sections (Introduction, Main Content, Examples, Summary).
- Provide multiple presentation styles (academic, storytelling, business pitch, technical briefing).
- Offer customization of templates, colors, and cultural sensitivity (local examples, language).

4.Real-Time Assistance and Feedback

- Suggest additional teaching materials (quizzes, case studies, discussion prompts).
- Provide alternative slide variants for better engagement.
- Generate speaker notes automatically from slide content.

Technical Challenge:

Develop a **lightweight, AI-driven presentation engine** that balances personalization, automation, and efficiency. The system must handle multimodal content generation while ensuring **accuracy, contextual relevance, and rendering quality** across different environments.

1.Key Innovations Required:

- **Prompt-to-Slides Pipeline**: NLP-driven content extraction and structured slide generation.
- **Image & Media Relevance Engine**: Semantic search and computer vision for selecting slide-specific media.
- **3D Visualization Module**: Lightweight 3D rendering for domain-specific needs (STEM, architecture, medicine).
- **Adaptive Layout Algorithms**: Dynamically choose best slide designs to balance text, visuals, and whitespace.
- **Cultural & Linguistic Adaptation**: Generate slides in multiple languages with region-specific relevance.

2.Training and Data Engineering:

- **Educational Dataset Curation**: Collect structured lesson plans, textbooks, and multimedia references.
- **Media Alignment Training**: Match textual prompts with relevant image/video/3D assets.
- **Style & Pedagogy Mapping**: Train models on presentation styles (academic, corporate, storytelling).
- **Evaluation Metrics**: Relevance, engagement score, preparation time reduction, and cross-language adaptability.

Problem Statement 3: Offline AI Learning Platform for Rural Students

Challenge Overview:

Design an offline-first, **modular** AI-powered educational platform optimized for low-resource devices (4–8 GB RAM) in rural areas with unreliable internet. The system must support quizzes, homework, contextual summarization, and lesson visualizations fully offline, while enabling smart synchronization when intermittent connectivity is available.

The Problem:

Most existing educational AI platforms assume constant internet access and modern devices. In rural India, students rely on older smartphones and PCs with limited RAM and little or no connectivity. Current solutions fail to provide offline, adaptive, and culturally-relevant tools like quizzes, homework generation, and mind maps, which are critical for independent learning. There is a pressing need for a scalable, modular AI platform that enables quality education offline and syncs intelligently only when online.

Core Requirements:

1.Lesson Plans :

- Generate speech/chat-based lesson summaries, study notes guides offline.
- Modular activation: lightweight summarization on 4 GB, richer speech/text fusion on 8 GB.

2.Exam & Homework Generator:

- Auto-generate NCERT/CBSE/state-aligned assessments (objective, subjective, MCQs, descriptive).
- Offline grading of objective items; subjective responses (text, photo, voice) stored for sync.

3.Lesson Flow Diagrams & Mind Maps:

- Auto-generate visual flow diagrams or concept maps of chapters and topics.
- Support both student (simplified) and teacher (detailed) versions offline.

4.Offline Progress Tracking:

- Record detailed student activity (quiz scores, lesson completion, homework attempts).
- Sync securely with LMS only when the internet is detected.

5.Smart Synchronization & Updates:

- Detects connectivity automatically.
- Sync only **delta updates** (changed lessons, questions, or diagrams).
- Predictively prefetch upcoming modules when partial connectivity is detected.

Multilingual & Culturally Adaptive (Bonus Feature):

- Support at least **6 major Indian languages** offline.
- Region-specific examples to ensure cultural relevance.

Parent-Friendly Voice Reports (Bonus Feature):

- Generate offline **voice reports** in local languages for parents.
- Accessibility features: dyslexia-friendly fonts, large text, text-to-speech.

Technical Challenge:

The solution must address:

1.Offline-Capable AI Models

- Scaled-down models for summarization, question generation, and diagram building.
- Techniques: distillation, pruning, quantization for 4–8 GB RAM devices.

2.Modular Feature Enablement

- 4 GB devices: quizzes, homework generation, offline progress.
- 6 GB devices: add flow diagrams/mind maps.
- 8 GB devices: full summarization, multilingual support, parent reports.

3.Smart Sync & Update Efficiency

- Auto-detect connectivity.
- Minimize payloads via delta updates.
- Ensure data integrity during intermittent network availability.

4.Cultural & Multilingual Adaptation

- Support multilingual question/answer generation and code-switching (e.g., Hindi-English).
- Embed region-specific references for inclusivity.

Expected Solution Quality:

Deliver a fully functional offline-first educational AI platform that:

- Works reliably on low-resource hardware.
- Provides quizzes, homework, summaries, and diagrams offline.
- Auto-syncs content without bandwidth-heavy operations.
- Supports multilingual, culturally-aware content delivery.

Solution Architecture Requirements:

Mandatory Components:

- Offline Quiz & Homework Engine (lightweight, NCERT/CBSE aligned).
- Summarization & Study Assistant (speech/text-based, modularized per RAM tier).
- Flow Diagram & Mind Map Generator (local rendering of topic structures).
- Offline Progress Tracker & Sync Manager (local-first with delta updates).
- Multilingual & Accessibility Layer (6+ languages, parent voice reports, dyslexia support).

Problem Statement 4: Teacher Performance Evaluation Gap

Challenge Overview:

Design a transparent, ethical, and unbiased AI system that provides comprehensive evaluation of teacher performance in classrooms, going beyond traditional exam-based metrics.

The Problem:

Current teacher evaluation systems rely heavily on student test scores and subjective observations, missing crucial aspects of teaching effectiveness. There's a need for fair, comprehensive assessment that captures the full spectrum of teaching quality while respecting cultural sensitivities and avoiding bias.

Core Requirements:

1.Teaching Style Analysis

- Detect nuanced cues such as body language, voice tone, facial expressions, and eye contact from classroom sessions

2.Effectiveness Measurement

- Assess vocabulary complexity, clarity of explanation, adaptability to student responses, and quality of engagement

3.Bias-Free Validation

- Integrate anonymous student feedback to validate comprehension while reducing bias from self or peer reviews

4.Quantifiable Metrics Generation

- Produce interpretable indicators like engagement levels, concept clarity, and time management

5.Learning Outcome Correlation

- Link observed teaching behaviors with measurable outputs such as test scores, retention rates, and participation

Technical Challenge

Develop an AI system that solves the complex multimodal analysis and bias mitigation problem in diverse educational environments. Your solution must tackle:

1.Advanced Multimodal Processing:

- Real-time fusion of video, audio, and interaction data with minimal computational overhead
- Robust feature extraction for teaching behaviors across varying recording conditions and classroom layouts
- Cross-cultural gesture and expression recognition that accounts for regional communication styles

2.Bias Detection and Mitigation:

- Algorithmic fairness techniques that prevent discrimination based on appearance, accent, or cultural background
- Transparent evaluation frameworks that can be audited and explained to stakeholders
- Demographic parity constraints while maintaining evaluation effectiveness

3.Privacy-Preserving Analysis:

- On-device processing capabilities that minimize data transmission
- Differential privacy techniques for protecting teacher and student identities
- Secure multiparty computation for collaborative evaluation scenarios

4.Contextual Intelligence:

- Understanding of pedagogical best practices across different subjects and grade levels
- Adaptation to varying classroom sizes, infrastructure, and cultural contexts
- Integration of domain expertise in education with AI-driven insights

Expected Solution Quality:

Create a **fully functional evaluation system** with demonstrated fairness across diverse teacher demographics, privacy compliance verification, and integration with existing school management systems.

Solution Architecture Requirements:

Mandatory Components:

- Multimodal data fusion engine processing video, audio, and interaction streams
- Bias detection and mitigation framework with algorithmic fairness guarantees
- Privacy-preserving analytics pipeline with on-device processing capabilities
- Cultural adaptation module supporting diverse pedagogical styles

Problem Statement 5: AI Avatar Teacher and Real-Time Educational Translation.

Challenge Overview:

Design an intelligent AI avatar system that creates realistic, culturally-appropriate virtual teachers capable of delivering personalized education with real-time multilingual translation and interpretation capabilities.

The Problem:

Rural schools often face severe teacher shortages, especially for specialized subjects like advanced mathematics, science, and English. Students miss critical learning opportunities due to unavailable qualified teachers. Additionally, language barriers prevent students from accessing quality educational content available in other languages, creating educational inequality.

Core Requirements:

1.Realistic Avatar Generation and Animation:

- Create culturally-appropriate, diverse teacher avatars that reflect regional demographics and build student trust
- Natural facial expressions, lip-sync accuracy, and body language appropriate for Indian classroom contexts
- Gender and age-appropriate avatar selection based on subject matter and student preferences

2.Real-Time Educational Translation and Interpretation:

- Live translation of educational content across 22+ Indian languages while preserving technical accuracy
- Context-aware interpretation that maintains pedagogical intent and cultural relevance
- Support for complex educational terminology, mathematical concepts, and scientific notation

3.Generative Teaching Capabilities:

- Dynamic lesson creation based on curriculum requirements and student progress
- Adaptive explanation generation using multiple teaching approaches (visual, auditory, practical examples)
- Interactive Q&A sessions with intelligent response generation and follow-up questions

4.Classroom Presence and Engagement:

- Eye contact simulation and attention management across virtual classroom environments
- Voice modulation and speaking pace optimization for different age groups and subjects
- Interactive gestures and visual aids generation synchronized with lesson content

5.Cultural and Pedagogical Adaptation:

- Teaching style adaptation based on regional educational practices and student cultural backgrounds
- Integration of local examples, stories, and cultural references in lesson delivery
- Respectful representation of diverse Indian cultural contexts without stereotyping

Technical Challenge

Develop an integrated system that combines cutting-edge computer graphics, natural language processing, real-time translation, and educational AI to create convincing, effective virtual teachers. Your solution must address:

1.Advanced Avatar Technology:

- Real-time 3D avatar rendering optimized for low-resource devices with photorealistic quality
- Emotion and engagement detection for responsive avatar behavior adaptation
- Efficient animation pipelines that maintain 30+ FPS performance on target hardware

2.Multilingual AI Integration:

- Neural machine translation optimized for educational content with domain-specific terminology
- Code-switching detection and handling for mixed-language classroom interactions
- Semantic preservation across languages ensuring educational concepts remain accurate

3.Generative Teaching Intelligence:

- Large language models fine-tuned for pedagogical content generation with curriculum alignment
- Adaptive content difficulty scaling based on real-time student comprehension assessment
- Interactive dialogue systems capable of handling diverse student questions and misconceptions
- **Educational Domain Fine-Tuning**: Mandatory fine-tuning on teacher-student interaction datasets, educational dialogue corpora, and subject-specific pedagogical content to achieve human-level teaching quality and cultural appropriateness

4.Real-Time Performance Optimization:

- Low-latency processing pipelines enabling natural conversational flow (<500ms response time)
- Efficient resource management for simultaneous avatar rendering, translation, and content generation
- Network optimization for streaming high-quality avatar interactions in low-bandwidth environments

Expected Solution Quality

Build a **complete avatar-based teaching platform** with demonstrated multilingual capabilities, cultural sensitivity validation, and proven educational effectiveness through user testing.

Solution Architecture Requirements

Mandatory Components:

- 3D avatar generation and animation engine with cultural customization
- Real-time multilingual translation system with educational domain optimization
- Generative teaching AI with curriculum alignment and adaptive difficulty scaling
- Student engagement tracking and responsive avatar behavior system
- Cross-cultural validation framework ensuring appropriate representation

ROUND 1 – IDEA PRESENTATION & PROBLEM SELECTION

Objective: Select one problem statement and present your initial solution concept. Focus on **understanding the problem, ideation, and planning**.

Key Points to Cover in Your Presentation:

- **Problem Understanding:** Clearly define the challenge and its relevance.
- **Solution Approach:** Explain your proposed idea and how it addresses the problem.
- **Innovation & Feasibility:** Highlight unique features and technical viability.
- **Educational Impact:** Describe benefits for the target users.
- **Implementation Roadmap:** Outline steps, timeline, and milestones.
- **Team Readiness:** Showcase skills, roles, and resource planning.

Format:Presentation:

- 10-minute live presentation + 5-minute Q&A with an expert panel.
- Use the standardized presentation template provided.

ROUND 2 – DEVELOPMENT & SOLUTION PRESENTATION

In Round 2, teams advance from concept to active development, focusing on building a functional prototype, integrating core features, and refining the solution for technical, educational, and usability standards. Progress is demonstrated through two structured phases: **Phase 1** – core development and prototype creation, and **Phase 2** – feature completion, optimization, and solution refinement.

Phase 1: Development & Prototype:

Weekly Support & Mentorship:

- **Wednesdays:** Technical doubt resolution, architecture review, code quality assessment, team consultations
- **Saturdays:** Intensive mentorship, peer code reviews, expert lectures, progress showcase
- **On-demand:** Community platform support and peer learning encouraged

Project Setup & Planning

- Refine project proposal based on Round 1 feedback
- Finalize technical architecture and development environment
- Allocate resources, distribute API keys, and set up code repository

Core Development Sprint

- Implement basic architecture and integrate core AI models
- Set up database and wireframe user interface
- **Target:** 40% project completion
- **Prototype Milestone:**
  Functional prototype with core AI features must be submitted
  - Required: Basic UI, integration with Medha AI, technical documentation
  - Mentors provide performance benchmarking and guidance

Feature Enhancement

- Implement advanced features, refine user experience, optimize performance
- Testing and bug fixes
- **Target:** 70% project completion

Phase 2: Advanced Development & Final Presentation

Focus:

- AI model fine-tuning and optimization
- UX refinement and rigorous testing
- Performance and security optimization
- Integration with additional educational tools

Weekly Mentorship Continues:

- Wednesdays: Architecture review and optimization guidance
- Saturdays: Advanced feature development support

Milestone Target: 85% completion by end of Week 6

Final Presentation Requirement:

- Teams must present their developed solution after completing Phases 1 & 2

- **Format:** Live demo presentation per team (20 mins)
  15-min demonstration of working solution
  5-min technical Q&A with expert panel

ROUND 3 – FINAL DEVELOPMENT & ELITE MENTORSHIP PHASE

Round 3 consists of two key phases: **Phase 3** – Final Development & Mentorship, where teams refine their solutions with expert guidance, optimize features, and prepare technical documentation; and Phase 4 – Final round preparation, where teams present live demos, receive intensive coaching, and finalize production-ready solutions for evaluation at the Finale

PHASE 3: FINAL DEVELOPMENT & MENTORSHIP:

Expert Mentorship Integration

- Teams are assigned dedicated industry mentors.
- Educational practitioners test prototypes and provide feedback.
- Deep-dive review of technical architecture and performance optimization.
- Assessment of business viability, market potential, and go-to-market strategy.

Enhanced Weekly Support:

- **Mon–Tue:** Individual team mentorship (3 hours per team)
- **Wed:** Group workshops on advanced technical topics
- **Thu–Fri:** Implementation of expert feedback and optimization
- **Weekend:** Intensive development and peer collaboration

Advanced Polish & Optimization

- Optimize performance under hardware and system constraints.
- Conduct classroom testing with students and teachers.
- Implement advanced security measures and refine documentation.
- Develop a business model and sustainability plan.

Pre-Final Preparation

- Final code review and technical assessment by mentors.
- Professional presentation coaching and demo rehearsals.
- System testing, bug fixes, and quality assurance.

Deliverables by End of Phase 3:

- Production-ready solution with core features implemented.
- Technical documentation, API references, and user manuals.
- Business model and market analysis.
- 10-minute demo video showing solution functionality.
- Teacher/student feedback and testimonials.

Phase 4: Final Round Preparation:

In Phase 4, teams focus on finalizing and polishing their solutions for the Finale. This phase includes refining features, optimizing performance, and preparing professional presentation materials. Teams receive level-specific coaching, intensive mentoring, and rehearsal guidance to ensure high-quality demonstrations.

Evaluation:
Teams present live demos across all problem categories (P1–P5), including solution walkthroughs and Q&A with expert panels. Assessment criteria include:

- Functionality
- AI integration
- Usability
- Educational impact
- Innovation
- Scalability

Deliverables & Outcomes:

- Fully refined, production-ready solutions with comprehensive testing
- Complete technical documentation, user manuals, and API references
- Business models, market analysis, and sustainability plans
- Compilation of user feedback and teacher/student testimonials

Final round:

The Final Round is the culmination of weeks of innovation, development, and mentorship. Teams must demonstrate not only technical excellence but also a clear understanding of rural education challenges and the ability to deliver scalable, impactful solutions.

The evaluation process is designed to spotlight solutions with the strongest potential for real-world deployment and sustainable impact in transforming rural education across India.

Presentation Guidelines:

Allocation per Team

- Total Time: 25–30 minutes
- Presentation: Up to 20 minutes
- Q&A Session: 5–10 minutes

Presentation Structure:

1. **Product Overview** – Problem, solution, users, and innovation
2. **Technical Demonstration** – Live demo, AI integration, architecture, scalability
3. **Educational Impact & Validation** – Testing results, effectiveness, accessibility
4. **Implementation & Sustainability** – Roadmap, business model, future growth

Competition Timeline:

Date	Event
15 October	Deadline of Registration on Techfest Website
15-25 Oct0ber	1st Round
29 October	Announcement of 1st Round Qualifiers
30 Oct - 29 Nov	2nd Round
30 Nov	Announcement of 2nd Round Qualifiers
1 Dec - 15 Dec	3rd Round
16 December	Announcement of 3rd Round Qualifiers
22 December	Finale and Award Ceremony

Team Specifications and Eligibility

- **Eligibility**: Open to all students with a valid ID from their educational institution.
- **Team Size**: Teams may include students from different institutes. Maximum of 4 members per team.

General Rules:

1. Every participant must register online at **techfest.org**, receiving an ID for future reference.
2. Registrations for Round 1 are open until October 15, 2025.
3. The organizers' and judges' decisions are final and binding. Techfest reserves the right to verify participant details.
4. Techfest, IIT Bombay, is not responsible for late or lost entries.
5. The latest information will be available on **techfest.org**, with registered participants notified of changes via email.
6. Official communication will be through the Techfest email (jaya@techfest.org).
7. All entries must be the original work of the contestant/team.
8. Any form of plagiarism is prohibited and the contestant/team will be disqualified from the Challenge.
9. Finalists must present valid ID cards and provide a copy for verification

Certificate Policy:

Only those teams that are shortlisted for the finals and also give a final presentation about their work during Techfest 2025-26 would be awarded an **e-Certificate of Participation.**

Prize Money:

Prize money will be awarded to the **winners of each category (P1–P5)** via NEFT, latest by May 2026. Winners must email the following to **jaya@techfest.org** immediately after results:

Subject: "Cograd Competition, [Team ID] – [Position]" (e.g., "Cograd Competition, SP-2309234 – 1st Position")

Body:

1. Account Holder's Name
2. Account Number
3. Bank Name and Branch
4. IFSC Code
5. A photograph of the Bank Passbook as proof
